Control Barcode and SKU Matches in Global Search

Overview

Use **Barcode Likely Lookup** to choose whether Global Search can suggest products with similar barcodes or SKUs when an exact match is not found. Set it to **No** when barcode and SKU searches must return exact matches only.

Why this setting is useful

Similar identifiers can belong to different products. If the searched UPC does not exist, showing a product with a similar code can lead staff to select the wrong item. Exact matching helps staff distinguish a matching identifier from a similar suggestion.

Setting	Barcode or SKU search with no exact match
Yes	Can show products with similar barcodes or SKUs.
No	Shows no matching product instead of similar identifier results.

Find and update the setting

1. Open **Settings > Configuration**.
2. Under **Global Search**, find **Barcode Likely Lookup**.
3. Choose **Yes** for likely matches or **No** for exact matches only.
4. Select **Save Changes** to save the selection.

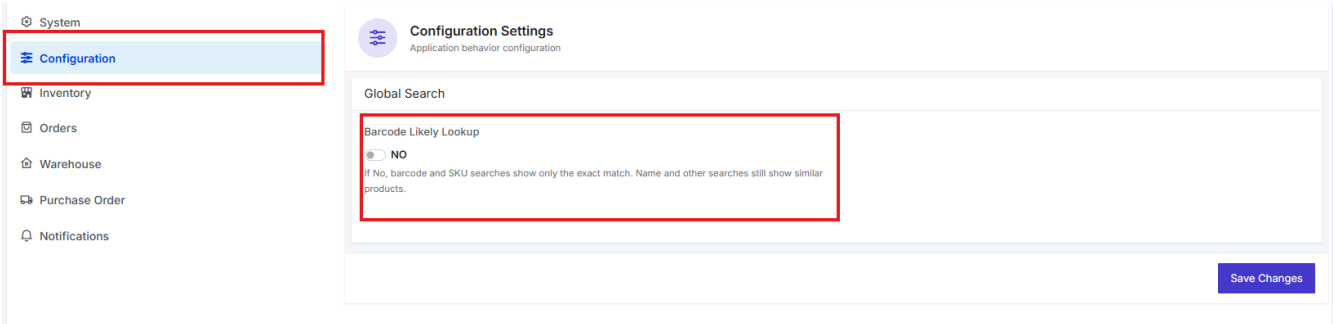

Figure 1 Configuration settings with Barcode Likely Lookup and Save Changes. The screenshot is cropped to the settings area for clarity.

What changes and what stays available

This control applies to barcode and SKU matching in **Global Search**. With the setting at No, name and other searches can still show similar products, as described by the setting help text.

The screenshots in this article illustrate the supplied application screens. Product prices, stock and identifiers are examples shown in those screens.

Allow similar matches with Yes

Behavior

When **Barcode Likely Lookup = Yes**, a barcode or SKU search with no exact match can return products with similar barcodes or SKUs. These are possible matches for review; the displayed code may differ from the code entered.

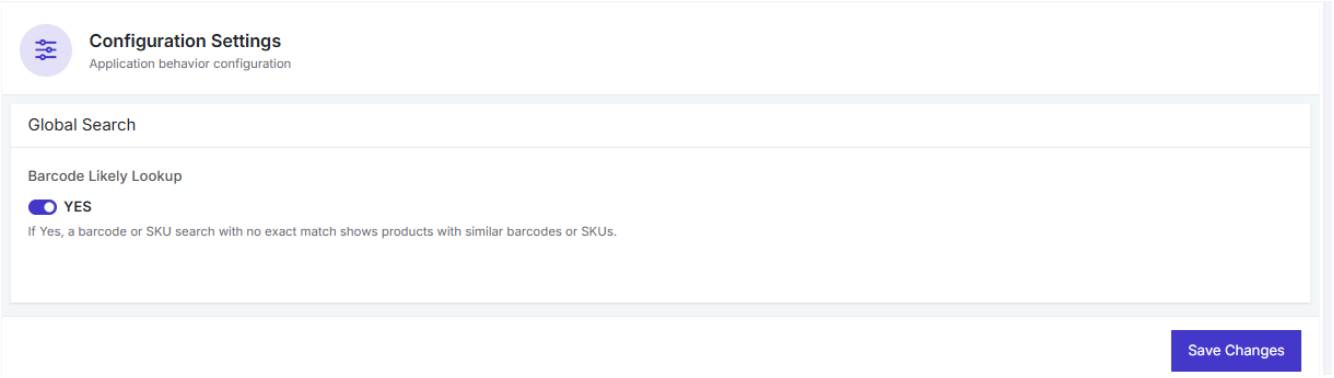

Figure 2 Yes allows similar barcode or SKU results when no exact match is available.

Example of similar results

The supplied example searches for **6284306**. The results show products with the different UPCs **62845106808** and **628451068013**. These results demonstrate likely matching rather than an exact identifier match.

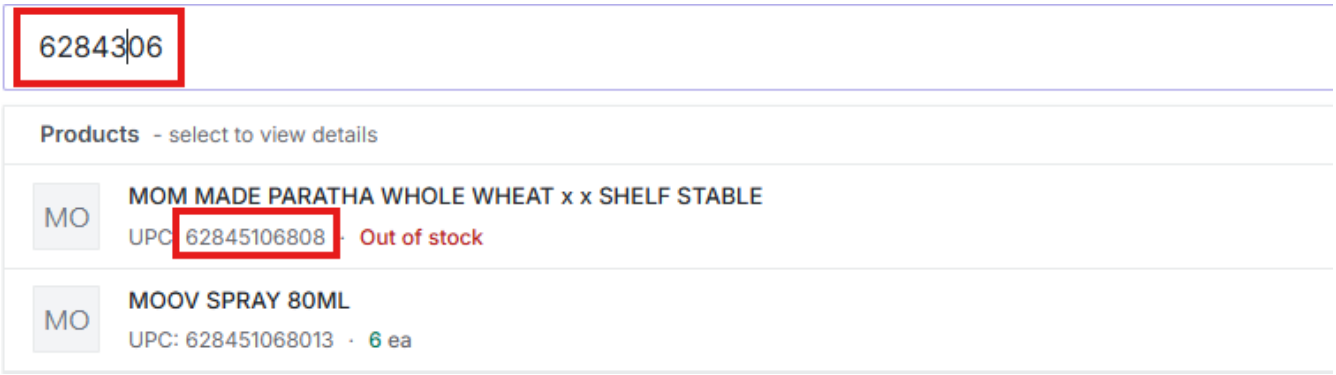

Figure 3 The entered identifier and the returned UPC differ. Review the full product identifier before selecting a suggested result.

How to use this mode

1. Save Barcode Likely Lookup as **Yes**.
2. Open Global Search using the search icon in the application header.
3. Enter the barcode or SKU.
4. If similar results appear, compare the product name and complete identifier with the item you intended to find.

When this mode is helpful

Use this mode when users need assistance finding a possible product from an incomplete or mistyped identifier. A likely result still needs to be checked before the user continues with a product action.

Similar matches are permitted when no exact match is found; they are not a confirmation that the searched code exists in the catalog. The screenshots demonstrate UPC examples, while the setting help also covers SKU searches.

Require exact matches with No

Behavior

When **Barcode Likely Lookup = No**, barcode and SKU searches return only an exact match. If there is no exact identifier match, the product area shows a no-match result instead of products with similar identifiers.

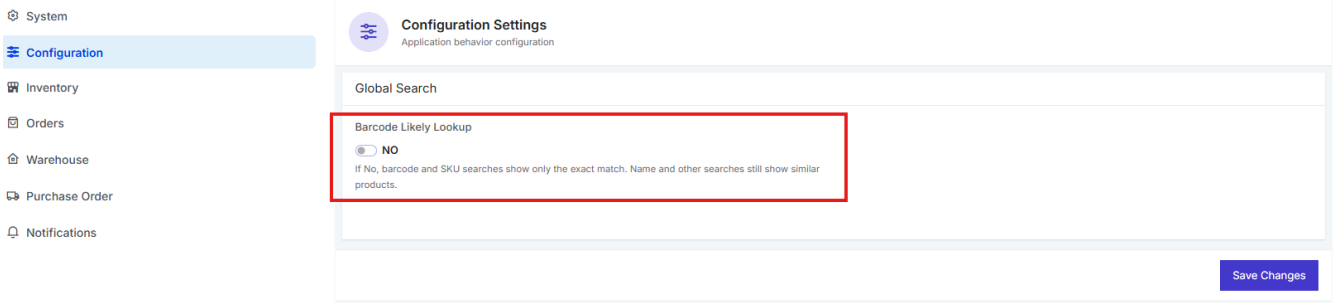

Figure 4 No limits barcode and SKU results to exact matches. Name and other searches can still return similar products.

Example of no exact match

The supplied example searches for **62845106**. The product area displays **No matching products found**. This tells the user that the identifier did not produce a matching product in that search.

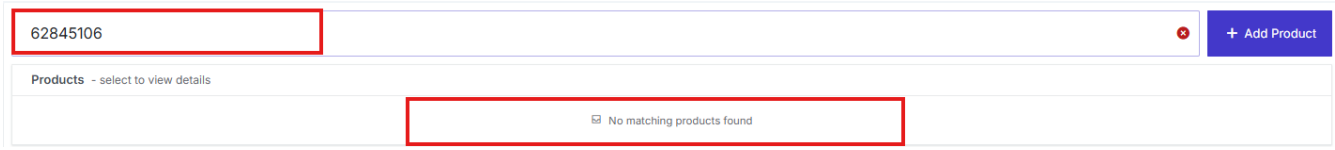

Figure 5 No matching products found is the message visible in the supplied screenshot.

How to use this mode

1. Save Barcode Likely Lookup as **No**.
2. Open Global Search and enter the complete barcode or SKU.
3. If a product is returned, check that its identifier matches the search.
4. If no product is found, check the entered identifier. Search by product name separately if you need to investigate further.

Expected benefit

Exact matching reduces the chance of selecting a different product simply because its barcode or SKU resembles the searched value. It provides a clear choice for stores that require precise identifier lookup.

The Yes and No screenshots use different entered values. They illustrate the two behaviors; they are not a before-and-after test using the same search value. No-match results do not by themselves prove that the product is absent under every other identifier or search type.

Recognize an exact match

Example

The search value **2342342342** matches the displayed UPC **2342342342** for **Golden Atta**. The search field and the product UPC contain the same complete value.

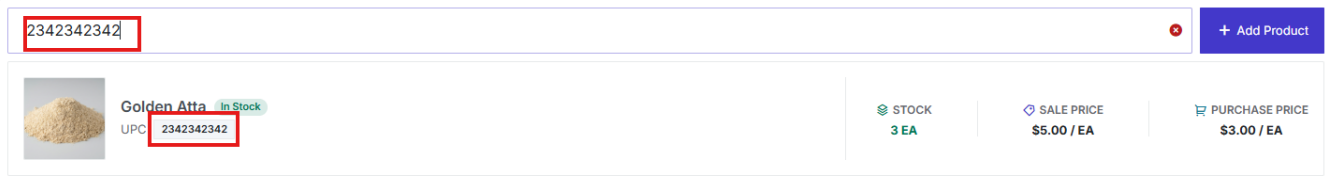

Figure 6 The search returns Golden Atta with the matching UPC.

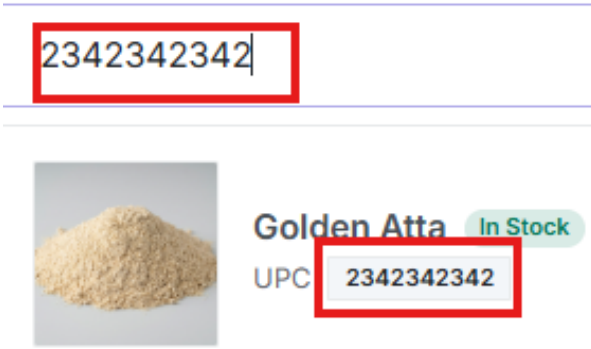

Figure 7 Enlarged detail showing the identical search value and product UPC.

Quick reference

Search situation	Yes	No
Exact barcode or SKU exists	Exact-match product can be found.	Exact-match product can be found.
No exact match but similar identifiers exist	Similar products may appear for review.	No matching product is returned for that identifier.
Product name or other search	Similar results remain available.	Similar results remain available.

Questions users may ask

Why do I see a product with a different UPC?

Barcode Likely Lookup may be set to Yes. Compare the full identifier before selecting it.

Why does a name search still show similar products after I select No?

No changes barcode and SKU matching. The setting help states that name and other searches still show similar products.

Which option meets an exact UPC lookup requirement?

Select No and save the setting. A missing exact match then produces a no-match result.

Article scope: Global Search only. This setting does not establish matching behavior for every product picker, import, POS scanner or other search field in the application.

Permanently Delete a Product from the Deleted Tab

Overview

Use **Inventory > Products > Deleted** to review products already marked as deleted. Each listed product has a red delete action for permanently deleting that selected product from the deleted list.

Why this feature is useful

The Deleted tab gives users a dedicated place to review deleted product records and access the permanent-delete action for a specific product.

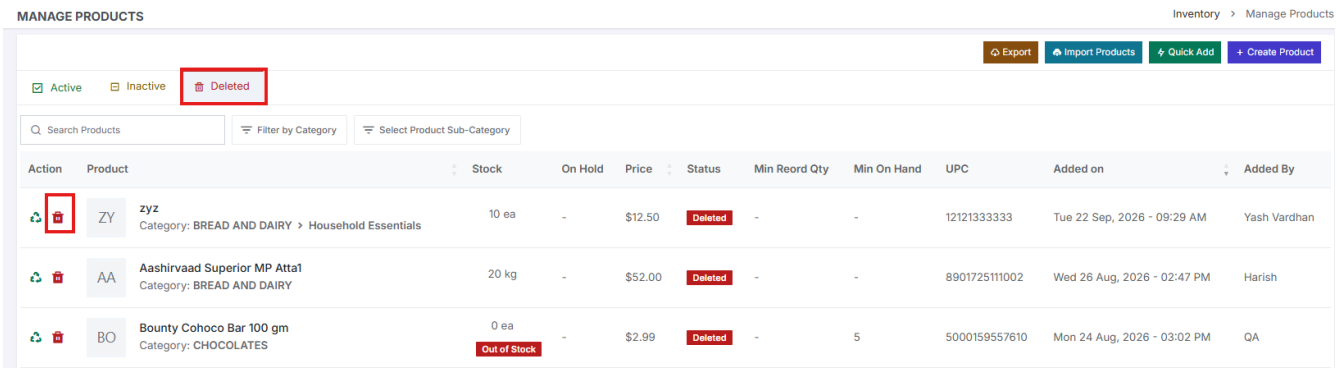

Figure 8 Deleted is selected. The list shows products with Deleted status and a red delete icon on each row.

Delete the selected product

1. Open **Inventory > Products**.
2. Select the **Deleted** tab.
3. Use Search Products, category or subcategory filters to locate the product.
4. Check the product name and UPC in the row.
5. Select that row's **red trash icon** to initiate permanent deletion. Follow any confirmation presented by the application.
6. Review the Deleted list to verify the result for the selected product.

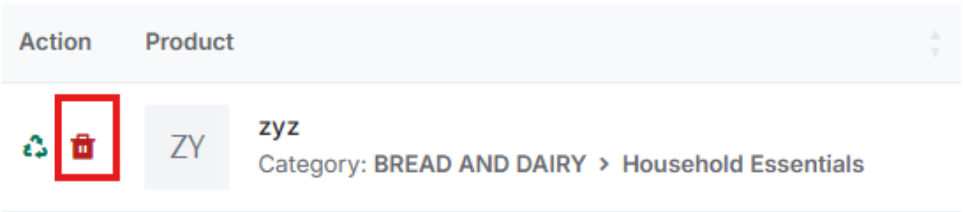

Figure 9 Enlarged row detail. The red trash icon is the delete action highlighted in the supplied screenshot.

Understand the two stages

A product appearing in the Deleted tab is already marked as deleted. The red delete action in this tab is the permanent-delete step. Verify the intended product before proceeding; treat this action as permanent removal.

The screenshot establishes the tab and row actions. The exact confirmation dialog, permission rules, dependency restrictions, and effects on existing stock or historical transactions are not shown. No deletion was performed to prepare this article.
